

# AZ-104 Questions: Master Manage Azure Identities and Governance With Confidence

Many candidates preparing for Microsoft Azure certification discover that AZ-104 exam questions become especially challenging when the topic is Manage Azure identities and governance. This domain looks simple at first because it includes familiar terms such as users, groups, subscriptions, policies, and access control. However, during the real exam, these concepts are tested through layered scenarios rather than direct definitions. That is why many learners who perform well in labs still struggle with AZ-104 exam questions in this section.

For IT administrators, cloud engineers, and working professionals preparing after office hours, the real problem is not lack of knowledge. The issue is understanding how Microsoft frames governance and identity tasks inside real-world decision-making questions. If you want to pass confidently, you must know how to solve these [Azure Administrator Associate AZ-104 Questions](#) in the exam faster.

## Why Identity Questions Often Look More Complex Than They Are

The identity portion of the AZ-104 Exam commonly tests Microsoft Entra ID, user management, group assignments, password reset options, conditional access, and role-based access control. In study guides, these topics seem straightforward. In AZ-104 Exam Questions, they are combined into business scenarios.

For example, instead of asking what RBAC means, the exam may describe a company with multiple departments, limited admin permissions, and a need for least-privilege access. You then need to choose the correct built-in role. This turns a memory question into a judgment question. Many AZ-104 questions feel difficult because two answer choices may both seem technically correct, but only one meets the exact requirement. That is where careful reading matters.

## Governance Questions Test Decision-Making, Not Memorization

Governance includes subscriptions, management groups, tags, Azure Policy, locks, cost controls, and compliance structure. Candidates often memorize definitions but fail scenario-based AZ-104 Exam Questions because they do not know when to use each tool.

A common example is confusing Azure Policy with RBAC. Policy controls what can be deployed or enforced, while RBAC controls who can perform actions. In real exam wording, both may appear in the same question. If you do not understand the business need, you may choose the wrong answer.

<b>Azure Governance Tool</b>	<b>Primary Purpose</b>	<b>Common Exam Trap</b>
RBAC	Control user permissions	Confused with Policy
Azure Policy	Enforce standards and compliance	Chosen when access control is needed
Management Groups	Organize subscriptions	Mistaken for resource groups
Resource Locks	Prevent deletion or modification	Ignored when protection is required
Tags	Cost tracking and organization	Mistaken as security control

This is why governance-based AZ-104 Exam Questions often feel harder than compute or storage topics.

## **Microsoft Uses Real Administrative Logic**

The exam is designed for administrators managing live Azure environments. That means AZ-104 questions often ask what is best, fastest, most secure, or least administrative effort. These phrases matter. If a question asks for the minimum permissions required, Global Administrator is rarely correct. If it asks for centralized governance across many subscriptions, management groups become stronger candidates than resource groups. The difficulty comes from choosing the best operational answer, not merely a working answer. Many candidates lose marks because they select what could work instead of what Microsoft recommends.

## **Multi-Step Wording Increases Pressure**

Another reason AZ-104 Exam Questions feel tricky is structure. A question may include several conditions such as location restrictions, budget controls, delegated permissions, and audit requirements. You must process all conditions quickly. For busy professionals, this becomes harder under exam pressure. The best method is to identify the final requirement first, then match the Azure service that solves it. Ignore extra wording that does not change the technical decision.

## **Identity vs Governance: Where Candidates Get Confused**

Sometimes learners study identity and governance separately, but the exam merges them. A user may need access to deploy only approved resources within a subscription. That scenario uses both RBAC and Azure Policy.

Scenario Requirement	Correct Thinking Path
User needs reader access only	RBAC role assignment
Only approved VM sizes allowed	Azure Policy
Prevent accidental deletion	Resource Lock
Apply standards to many subscriptions	Management Group + Policy
Delegate billing visibility	Subscription scope permissions

When you practice mixed scenarios, AZ-104 Exam Questions become easier to decode.

## How To Prepare Smarter For This Domain

Instead of memorizing every feature, learn relationships between services. Ask yourself who controls access, what enforces standards, where scope applies, and how administration scales. That mindset mirrors the real exam. Use labs where possible, but also spend time with scenario-based AZ-104 questions. Practice reading short case studies and selecting the most efficient Azure solution. This is the bridge between technical knowledge and exam success. Also review common built-in roles, policy inheritance, subscription hierarchy, and governance boundaries. These appear regularly in modern AZ-104 Exam Questions.

## Pass With More Confidence Using Targeted Practice

If you are an IT professional preparing around a busy schedule, random study is expensive in time and confidence. You need practice that mirrors how Microsoft writes **AZ-104 Exam Questions**. **P2PExams** is built for candidates who want focused preparation, lower anxiety, and complete syllabus coverage. Their realistic PDF questions and Practice Test applications help you experience the real exam style before test day. With free demo access and a no-nonsense system, it helps serious learners prepare quickly, thoroughly, and confidently for the AZ-104 Exam.

## Quick FAQ For Candidates

### Why do identity questions feel harder than storage questions?

Because identity questions often involve permissions logic, least privilege, and multiple correct-looking answers.

### **Are governance questions mostly theoretical?**

No. Most AZ-104 exam questions test practical administration choices such as enforcement, organization, and cost control.

### **Should I memorize every Azure role?**

No. Focus on the most common roles and understand permission scope.

### **How many times should I practice this section?**

Repeat until you can identify whether the question is about access, compliance, hierarchy, or protection within seconds.
